

Interviewee F

**What is global warming?**

Global warming is where the world is getting too warm by everything that's being is getting pushed out in to the energies and , basically man made products are, that's what I think global warming is

Air travel is one of the things, ukk oil pumping out, just a lot of the energy, I don't think that's it's one thing, man made is the thing that I think is causing global energy

**How does that contribute to Global Warming?**

Umm, just whatever it's sending out in the atmosphere really this isn't my thing I should follow it more we should all follow it more,, that's my understating of it...we should all understand it

The world's not a place like it used to be, there's so much more energies and going around that we didn't use years ago

I mean flying is a massive thing, the thing the other day with the ash, the other week, the other month, it was good the world was grounded

**How did that actually affect global warming?**

Well I imagine with it being sent out into the atmosphere, I think it's not something I study so I don't know what the answer is

**What do you think we can actually do then about global warming?**

Make people like me, more aware. But to outreach in a different way than via the news, perhaps it's gotta be something that we've all gotta wear a seatbelt, everybody knows because it becomes law, so perhaps there's gotta be certain things put in place that make is more aware of global warming.

**What is "climate change?"**

In just a few words climate change is our world is changing

**What is the "greenhouse effect?"**

Greenhouse effect is that we are becoming warmer and the ice is melting because in a greenhouse that is where we grow our green and healthy products if we wanted to so we that effect

**What is the hole in the ozone layer/ozone depletion?**

Is a hole in the ozone, is a hole letting gases in or out, That's what I think, I'm kind of embarrassed I don't know

**What's the difference between climate and weather?**

Weather is created by the atmosphere rain comes when the clouds accumulate in the sky

Climate is the temperature we are all experiencing it's goes from one end of the spectrum, very very cold and very very hot, there isn't the in between there perhaps used to be gone from one extreme to the other

### **How do you know?**

The news, not magazines, not the movies, um, just hearsay, I think hearsay, like I said before, just perhaps this makes me think I'd like to know more, do I need to know more...

Is that something that maybe your government is implementing, or your school? what can I do, recycling, I s something that I think I do do, I think everyone does a lot more than they used to. I think twice before I ever throw anything in the bin, I think we recycle everything we can, that's been the effect of certainly something to do with .. definitely, if that something the gov't is implementing. I think so they definitely have a role in it.

We as a community have a role we as a community, are aware of everything that's happened.
